

CUSTOMER RETENTION ANALYSIS

Abstract :

Customer retention is a key factor in improving business growth and profitability. This project, Customer Retention Analysis, aims to identify the factors that influence customer loyalty and understand why customers continue using or leave a company's services. The analysis is performed using customer demographic, behavioral, and transaction data to uncover meaningful patterns and trends.

The project includes interactive Power BI dashboards that provide an executive overview of business performance, customer profile analysis, customer behavior analysis, customer retention analysis, customer value tracking, and business insights with recommendations. Various Key Performance Indicators (KPIs), charts, and visualizations are used to monitor retention rates, customer lifetime value, purchase frequency, and churn patterns.

The insights generated from this analysis help businesses identify high-value customers, understand customer needs, reduce customer churn, and develop effective retention strategies. Overall, this project demonstrates how data analytics and business intelligence tools can support better decision-making and improve customer satisfaction, leading to increased revenue and long-term business success.
